CLIENT ACQUISITION OPERATING SYSTEM

How DeepGrid wins clients

Who we sell to, what we sell, what we may claim, and how a lead travels — built as files the team and the tooling both read

2 segments now	price by function	9 claims retired	1 lead state machine

The knowledge exists. It is just not usable.

Four documents, fourteen contradictions, nine retired claims — and no operating layer

Where they disagree	What is in circulation	What survives verification
FY32 gross margin	84% (IM) · 88% blended (July) · 72% kit (BP-1A)	72% kit only; 88% needs 120% on non-kit
Defence revenue	“₹1 Cr” (IM, July deck)	₹23.01L delivered, different entity, MCEME IP
Mandate date	“Live since April 2026”	GSR 184(E) was a draft; AEBS binds 1 Jan 2027
Compute claim	“39.3 TOPS measured on FPGA”	Artix-7 ceilings ~1.8 TOPS. It is a derivation
Price advantage	“3–7×” (IM) · “12.9×” (July)	~2.8–6.5× vs imports; ~2.3× loaded on cost

What this costs, per message

Every outbound email, proposal and call prep needs a human to reconcile four documents and recall which claims were retired. Pay that tax wrongly once and the buyer's evaluator finds it — costing the credibility of the true claims too.

Why this is not a document problem

The thinking is good — the July deck has a real ICP scorecard, two-track positioning and a banned-claims list. It has just never been written somewhere a person or a tool can execute against. “Read BP-1A §7” is a research task, not a context file.

The system is a ladder: two prompts, one chain, six files

Levels 1-3 built · gate run four times · the fourth tested the segment we can actually sell

File	What it carries	Status
L1 prompts/	Qualify-lead + first-contact, four-part structure	BUILT — unvalidated
L2 chains/	5-step outreach round, checkpoint after qualify	BUILT — never run
01-offer.md	Five-line ladder AD0–AD4, each with its evidence state	FIXED — recovered from BP-1A
02-icp.md	Who buys, who does not, and the prioritisation test	Ready
03-voice.md	5 verbatim samples from BP-1B + banned-words list	FIXED — was never blocked
04-proof.md	Every claim we may make, with evidence state	Founder approval on claimable set
05-objections.md	10 road objections + a 7-item AGV gap register	Partial — AGV set needs real calls
06-process.md	Lead states, stages, owners, approval gates	Ready

Why files and not a document

Today every outbound message requires a human to reconcile four documents that disagree, and to remember which claims were retired. Files move that from a per-message task to a one-time write — and any tooling reads the same source the team does.

Round 4 — testing the sellable segment

Rounds 1-3 all tested outbound to a port — the segment we had just demoted to design-partner. Round 4 tested government/PSU + AD0, the one thing sellable today. It recovered the AD0 Tower spec, a second GeM record, and a price defence that exists. It also caught a scoring model that summed to 12 out of 10.

PART 01

Who we sell to

Two segments now, and the disqualifiers that save weeks

One segment sells today. The rest need something we do not hold

From 02-icp.md · the prioritisation test is what the buyer requires us to already hold

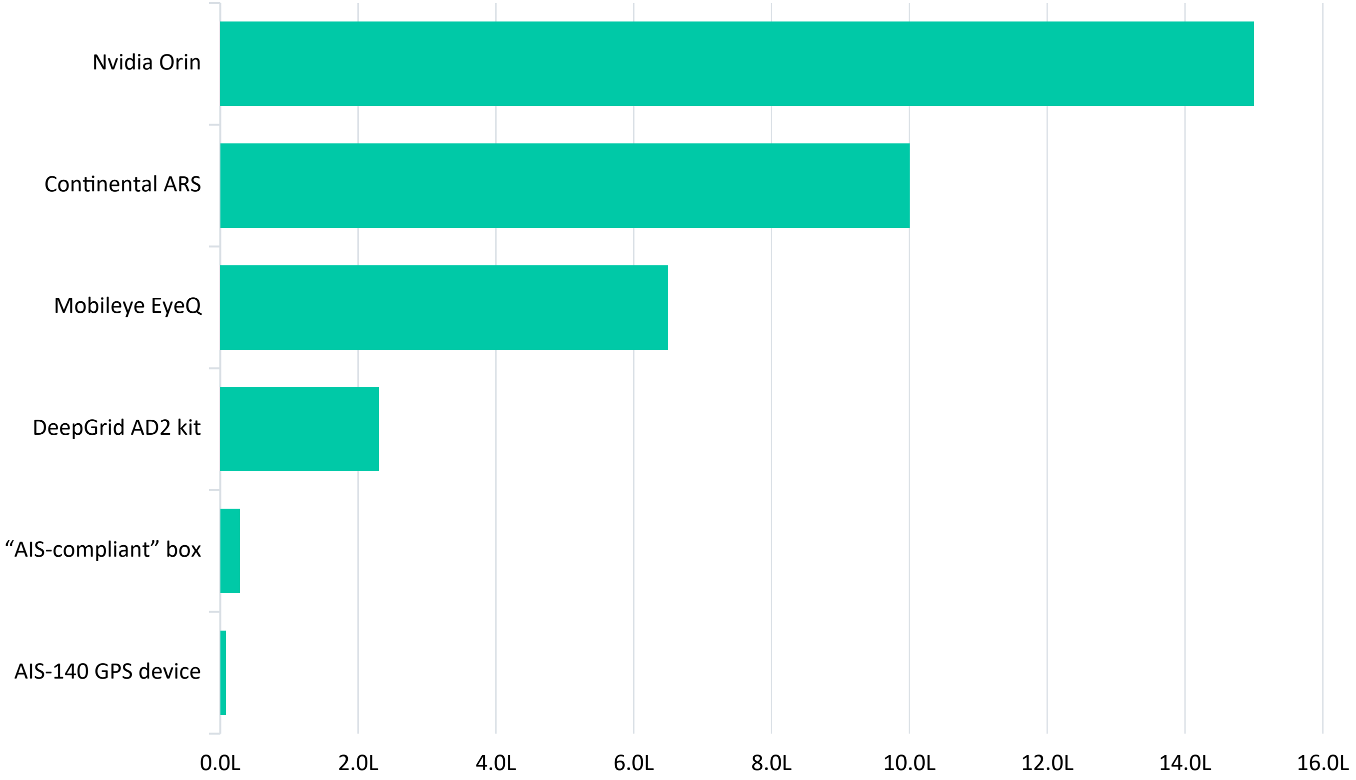
Segment	Why it is addressable	What it requires us to hold	Priority
Government / PSU / defence	Foreign silicon excluded by rule; GeM access proven	Eligibility, not certification	NOW
Plant, yard and port operators	Private land — no homologation gate at all	A working demo and a site reference — we have neither	DESIGN PARTNER
Large organised fleets (50+)	Real safety P&L, single decision-maker	Certified AEBS — not held until 2027	DESIGN PARTNER
OEM / Tier-1 line-fit	One relationship covers thousands of vehicles	Homologation + a relationship we lack	START NOW, CLOSES LATE

Disqualifiers — these matter more than the qualifiers

- Sub-five-truck operators (~3.5M). No purchasing process, price anchored at ₹4,500–11,000. Not addressable directly at any sane cost.
- Anyone buying purely to pass inspection — they will buy a ₹15,000–40,000 box and they are right to.
- Anyone needing certification today, or a quantified insurance outcome. Walk rather than invent one.

Two contests, and only one of them is winnable on price

The ladder the buyer actually sees — from 02-icp.md and 05-objections.md



How to use this in a room

Against imports we win 2.8–6.5×. That contest is settled and does not need re-arguing.

Against the compliance box we are ~20× the anchor. Price is not an argument we can win here.

So never open a fleet conversation on price. Open on certified AEBS — what the ₹30,000 box physically cannot do.

Keep the import comparison for OEM and Tier-1 rooms, where the alternative bid really is ₹6.5L and up.

VERIFIED *AIS-140 street pricing confirmed independently Aug 2026; import prices per company deck, not benchmarked*

Six products, not one price range

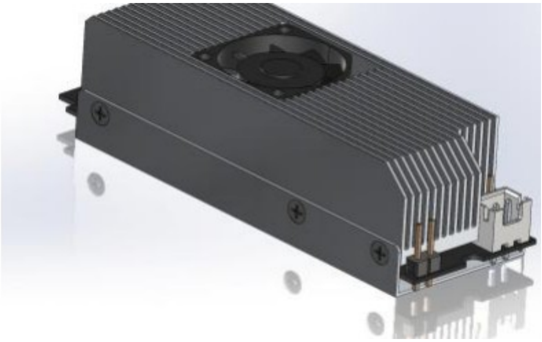
From 01-offer.md · AD0-AD2 is driver assistance · AD3 is it rented · AD4 is driverless

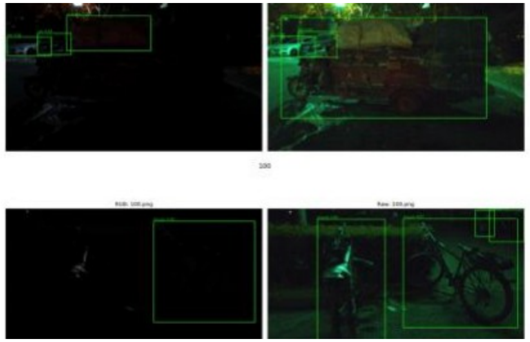
Line	What it actually is	ASP	Evidence today	Motion
AD0 basic	Smart mirror / 360° surround. Cameras replace mirrors; driver drives.	₹0.50L ⚠	Proven on FPGA	SELL
AD0 Tower	Pod: 3× 8MP cameras + 4D 77GHz radar + thermal + DMS + compute.	₹2.3L ⚠	Perception measured	SELL
AD2	Full truck kit — compute + software + sensors. Warns and can brake.	₹2.0–2.5L	Claim outruns silicon	SELL
AD3	The AD2 kit rented, not sold. Same hardware, different contract.	₹0.66 Cr/yr	Plan only, FY28+	PARTNER
AD4 Heavy	Driverless heavy transport AGV >5T. No driver in the cab.	₹3.50 Cr	No site, no reference	PARTNER
AD4 Seaport	Driverless container-yard AGV — stack to quay. No driver.	₹0.45 Cr	No site, no reference	PARTNER

⚠ Two products are both called AD0: ₹0.50L in the ADAS table, ₹2.3L for the Smart Mirror Tower — 4.6× apart, and only the Tower carries radar, thermal and DMS. Confirm which is being quoted before any AD0 outbound. The wider ₹0.50L-to-₹3.5 Cr spread is a ladder, not a discount band: AD0 and AD2 are what you sell, AD3 and AD4 are design partners only.

Price the function, give away the warnings

From 01-offer.md · the pricing change that removes the buyer's best objection





Function	What it is	Why it prices — or does not	Action
Certified AEBS (AIS-162)	Radar, brake actuation, proving-ground homologation	A ₹30k camera box cannot do this at any price	PRICE IT
Driver monitoring (DMS)	In-cabin perception, AIS-184 addressable	Hard to approximate; fleet-relevant	PRICE IT
LDW / BSD / warnings	Warning-only functions	Exactly what the cheap box does adequately	RIDE FREE

Sell the bundle and the buyer compares ₹2.3L to ₹30,000 on the box's terms. Sell the function and the box has no answer. Never open a fleet conversation on price.

Two tracks, two proof burdens, never the same room

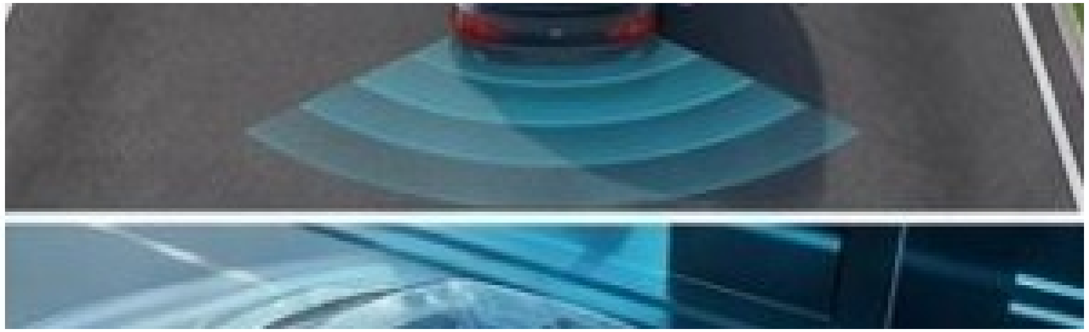
From 02-icp.md and 05-objections.md · positioning discipline

TRACK A · DEFENCE, PSU, YARDS — SELL NOW

Say: sovereign data, on-die HSM, Indian-designed, shipping on FPGA, GeM record, ₹23.01L delivered.

Never say: the retrofit price line, fleet ROI, or anything about insurance.

Gate: a named programme and a named SI partner by Month 3, or this is a services business rather than a silicon one.



TRACK B · FLEETS — RECRUIT DESIGN PARTNERS

Say: the 1 Oct 2027 AEBS requirement, one kit covering AEBS and DMS, influence over what gets certified for your fleet.

Never say: sovereign data, defence customers, or a 2026 deadline.

Gate: two design partners committing fleet access and a measurement baseline by Month 4.

A blurred statement reads as a company that has not chosen. The two stories are individually strong and jointly weak.

What we may claim — and the nine claims now retired

From 04-proof.md · this file is the ceiling on every claim the system may make

May be claimed

Claim	State
GeM procurement record held	CONTRACTED
₹23.01L delivered — Robot Training	CONTRACTED*
YOLOv11n at 40 fps on FPGA	MEASURED
Attention head at 24.25 ms	MEASURED
DGS001 running on FPGA	SILICON
15 provisional patents filed	FILED

** sits in Deepgrid Datacentre, not Semi. IP is MCEME-owned. Not ADAS revenue — this caveat must always travel with it.*

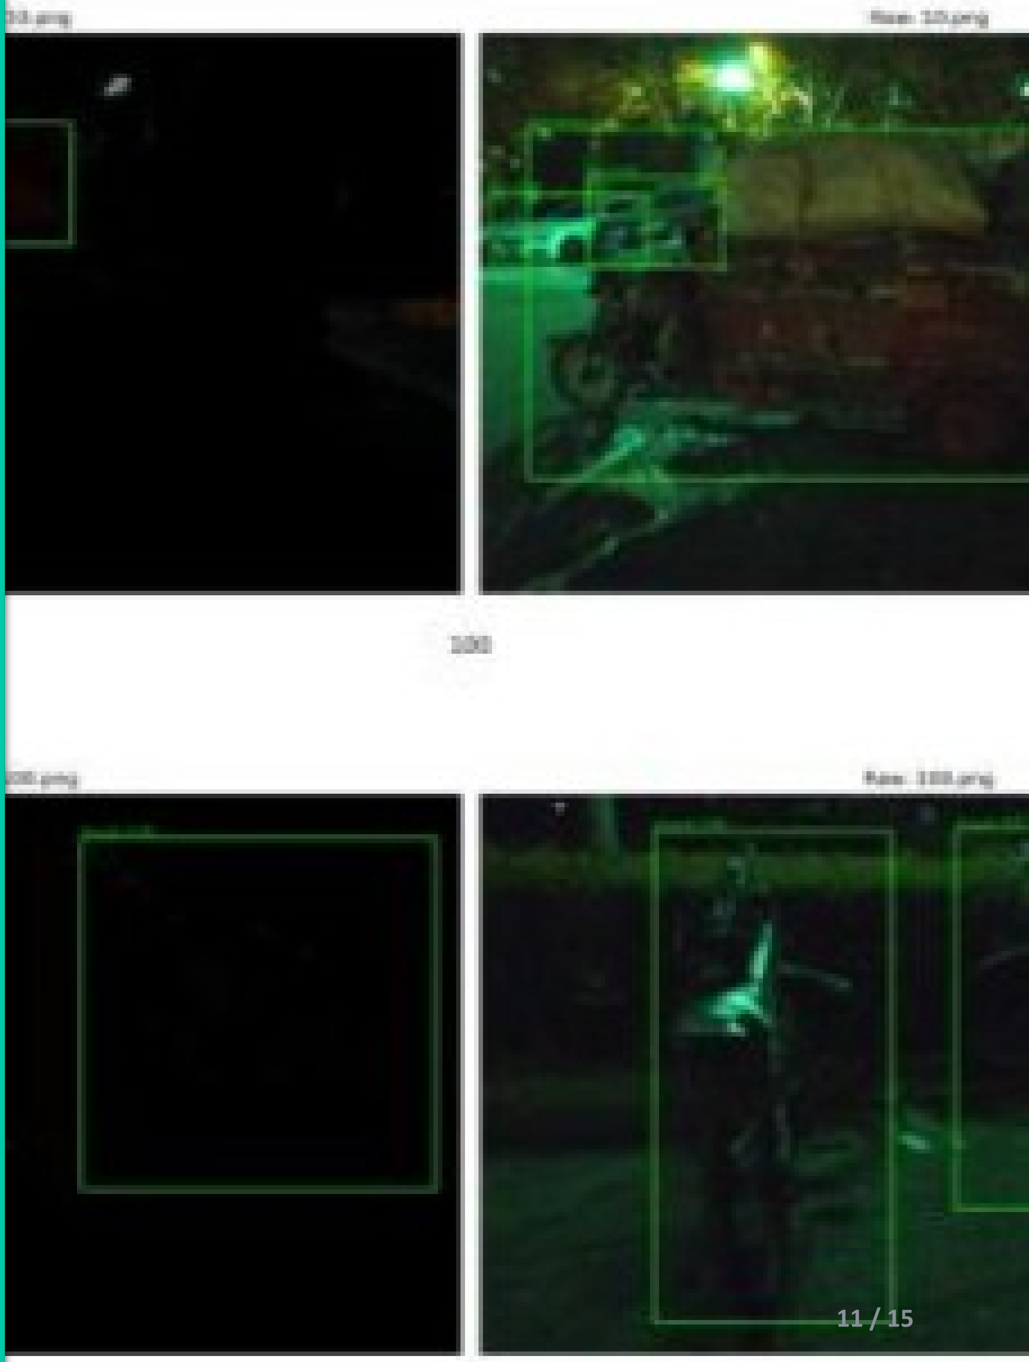
Retired — never say

Retired claim	Why
“39.3 TOPS measured”	Artix-7 ceilings ~1.8 TOPS
“84% / 88% gross margin”	Retracted; blend needs 120%
“12.9× cheaper”	Their ASP vs our die cost
“₹1 Cr defence revenue”	₹23.01L; rest is L1
“Transformer VLA on-chip”	Bandwidth-bound
“Mandate live since Apr 2026”	That rule was a draft
“Mandate-ready” · “ASIL-D”	Neither is held
Any insurance / accident %	No baseline, no actuary

PART 02

How a lead travels

One intake path, one state machine, written-down approvals



One intake path, one state machine, one record per lead

From 06-process.md · this is the foundation everything automated sits on

new → researched → contacted → replied → booked → proposed → won / lost / dead

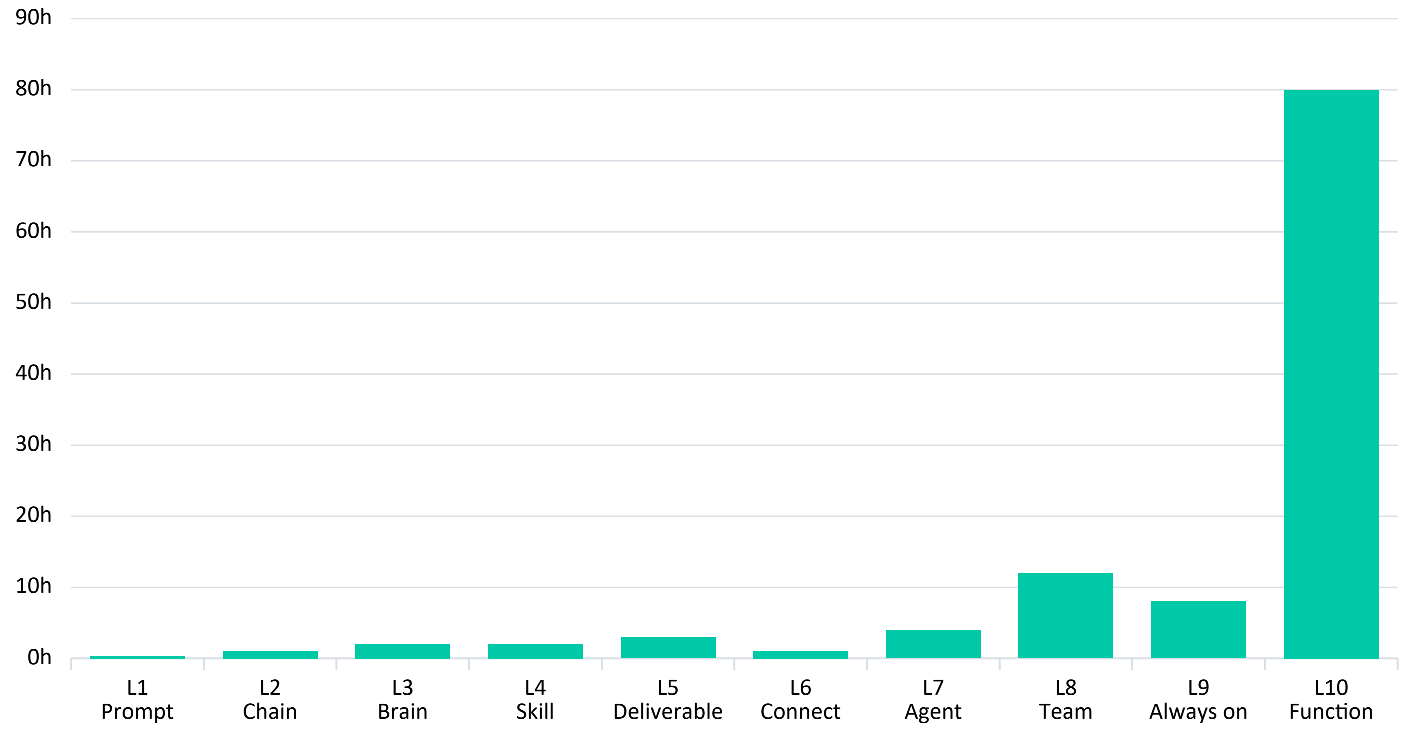
Every lead enters the same way regardless of source — referral, inbound, event, cold, GeM tender alert. Same record shape, same first step. Multiple intake paths is the most common reason these systems collapse.

Stage	What happens	Owner	Exit criterion
1–2	Source and qualify	Commercial lead	Passes ICP; disqualifiers cleared
3	Research	Commercial lead	Buying trigger found, or “none found” recorded
4–5	Contact and discovery	Commercial lead	Requirement, timeline, decision unit
6	Technical review	CTO	Their evaluator has seen demo and proof kit
7–8	Proposal and close	Commercial + founder	Priced by function; founder approved
9	Deploy	Engineering	Installed; baseline measurement started

Human approval, not negotiable: anything sent to a client · any price · any contract · any claim not in 04-proof.md · any lead scoring above 9.

Ten levels, built in order — we are at three

Each level must remove a task from somebody's calendar, or it is deleted



Effort is not the constraint — sequence is. Level 7 built on a broken Level 3 is just a faster mess.

L3

Building now

the Brain

L6

Blocked

no CRM exists

Why Level 3 first

Levels 1 and 2 are trivial once the Brain exists — and writing them first would encode the contradictions between the four source documents.

Level 6 is genuinely blocked: there is no CRM or shared store, so a connected system has nowhere to read and write.

That is a purchase decision, not something to engineer around.

PART 03

What happens next

Three founder decisions gate everything else

What happens next

Item 1 is one sentence from the founder and it blocks the whole port motion

#	Action	Owner	When	Why
1	Answer: is AD4 Seaport a vehicle or a retrofit kit?	Founder	Today	Decides replace-your-fleet vs convert-it; blocks all port outbound
2	Supply one real COLD email to a stranger	Founder	This week	5 samples recovered from BP-1B; all are replies, none are cold
3	Founder approves the claimable set in 04-proof.md	Founder	This week	Nothing goes out until this is signed
4	Founder approves pricing in 01-offer.md	Founder	This week	Price-by-function is a commitment, not a description
5	Re-run the cold-chat gate test after items 1–4	Commercial lead	Week 2	Run twice: guardrails pass, outbound still fails
6	Withdraw the June IM from circulation	Founder	Immediately	It carries six retired claims
7	Resolve the AD3 rent-vs-sale price conflict	Founder	Week 2	₹0.66 Cr/yr is ~26× the AD2 sale price
8	Name a defence programme and an SI partner	Commercial lead	Weeks 1–12	Track A has a proposition and no pipeline
9	Choose a CRM or shared store	Founder	Month 2	Unblocks Level 6 and everything above
10	Build the AD4 safety case, or stop pitching AD4	Founder	Before any port pilot	No funded functional-safety work exists for a driverless vehicle

Items 1–4 are founder decisions and they gate everything else. Item 1 is a single sentence. Item 10 is new: the driverless segment has no objection set and no safety case — until it does, AD4 is not pitchable as a product.
